No. 257.] **Marriages**—October, November, December, 1912. [Price 6d.  
**Births and Deaths**—January, February, March, 1913.

---

NOTE.—The figures in this publication are tabulated mainly from statistical Returns furnished by the local Registrars, and may not be found to correspond exactly with the authoritative figures for the whole year to be published later in the Annual Report.

General Register Office, Somerset House,  
30th April, 1913.

ENGLAND AND WALES.

The figures in this Return are based upon the BIRTHS and DEATHS registered in the 1,997 registration sub-districts of England and Wales in the three months ended 31st March, 1913; and the MARRIAGES in 15,907 churches or chapels, in 16,252 registered places of worship unconnected with the Established Church, and in 635 Superintendent Registrars' Offices, in the three months ended 31st December, 1912.

The births registered during the three months ended 31st March, 1913 numbered 216,330 and the deaths 146,556; the number of persons married during the three months ended 31st December, 1912 was 161,564.

**Marriages.**

The number of persons married during the *fourth* quarter of 1912 corresponds to an annual rate of 17·5 per 1000 of the population, which is estimated to amount to 36,539,636 persons at the middle of 1912; this is 0·8 per 1000 above the mean marriage-rate in the ten preceding fourth quarters, and also 0·7 per 1000 above the rate recorded in the fourth quarter of 1911.

**Births.**

The births registered in the *first* quarter of 1913 correspond to a rate of 23·8 annually per 1000 of the population, which is estimated to amount to 36,919,339 persons at the middle of this year; this is 3·1 per 1000 below the mean birth-rate in the ten preceding first quarters, and 0·6 per 1000 below the rate in the corresponding period of 1912; it is the lowest birth-rate recorded in any first quarter since the establishment of civil registration.

### Natural Increase of Population.

The natural increase of population in England and Wales last quarter by excess of births over deaths was 69,774, against 85,284, 80,455, and 77,947 in the first quarters of 1910, 1911, and 1912, respectively.

### Deaths.

The deaths registered in England and Wales last quarter correspond to an annual rate of 16·1 per 1000 persons living; this rate is 1·1 per 1000 below the mean rate in the ten preceding first quarters, but 0·2 above the rate recorded in the corresponding period of 1912.

The 146,556 registered deaths included 75,448 of males and 71,108 of females, the death-rate among males being 17·1, and that among females 15·1, per 1000 of the estimated populations of the respective sexes. Compared with the average for each sex in the ten preceding first quarters, the death-rate of males showed a decrease of 0·9, and that of females a decrease of 1·3. Out of equal numbers living, the deaths of males were to those of females as 113 is to 100 against 110 to 100 in the first quarters of the ten preceding years.

### Mortality at Different Ages.

Infantile mortality, measured by the proportion of deaths under one year of age to registered births, was equal to 122 per 1000, being 4 per 1000 below the average in the ten preceding first quarters.

The mortality among persons aged between one year and sixty-five years was at the annual rate of 8·6 per 1000 of the estimated population at this group of ages.

Among persons aged sixty-five years and upwards the mortality was at the annual rate of 100·9 per 1000 of the estimated population at this group of ages.

### Urban and Rural Mortality.

Table III. shows the birth-rates, the death-rates from all causes, from the principal epidemic diseases and from violence, and the death-rates at certain age groups, together with the proportion of inquest cases, of uncertified deaths, and of deaths in public institutions in England and Wales during the *first* quarter of 1913, compared with the corresponding average rates in the *first* quarters of the ten preceding years, and also with the rates last quarter in the 96 great towns, in the 145 smaller towns, and in the remainder of England and Wales.

In the country as a whole the mortality from measles last quarter was 43 per cent. in excess of the average; that from enteric fever, scarlet fever, and whooping-cough was little more than half the average, and that from diphtheria about two-thirds of the average.

The highest death-rates per 1000 persons living from the several epidemic diseases among the 96 great towns last quarter were as follows:—from *enteric fever*, 0·15 in Gillingham, in Wakefield, and in Stockton on Tees, 0·17 in Preston, 0·20 in Stoke on Trent, and 0·24 in Merthyr Tydfil; from *measles*, 2·04 in Preston, 2·22 in Stockton on Tees, 2·34 in Barrow in Furness, 2·92 in Swindon, 4·55 in Wigan, 5·17 in West Bromwich, and 5·65 in St. Helens; from *scarlet fever*, 0·27 in Newport (Mon.), 0·28 in Cambridge and in Darlington, 0·32 in Rhondda, 0·40 in St. Helens, 0·41 in Preston, and 0·46 in Aberdare; from *whooping-cough*, 0·53 in Ipswich, 0·57 in Wigan, 0·77

in Acton, 0·81 in Warrington, 0·84 in Cambridge, and 0·93 in Rotherham; and from *diphtheria*, 0·34 in Walthamstow and in Darlington, 0·38 in Devonport, 0·39 in Stoke on Trent, 0·40 in Burnley, 0·47 in Swansea, 0·52 in Rhondda, 0·53 in Portsmouth, 0·66 in Coventry, and 0·80 in Barrow in Furness. The highest death-rates per 1000 births from *diarrhœa and enteritis* among children under 2 years of age were 13·61 in Ipswich, 13·73 in Salford, 16·00 in Oxford, 16·31 in Burnley, 16·89 in Bolton, 21·29 in Stoke on Trent, and 30·24 in West Bromwich.

#### UNITED KINGDOM.

The POPULATION of the UNITED KINGDOM in the middle of 1913 is estimated at 46,035,570 persons; that of England and Wales at 36,919,339, that of Scotland at 4,733,700, and that of Ireland at 4,382,531.

In the United Kingdom 271,762 *births* and 189,675 *deaths* were registered in the three months ended 31st March, 1913. The natural increase of population was, therefore, 82,087. The number of *persons married* in the United Kingdom during the quarter ended 31st December, 1912, was 189,338.

The birth-rate in the United Kingdom in the *first* quarter of 1913 was 23·9, and the death-rate 16·7, per 1000 of the estimated population. The marriage-rate in the *fourth* quarter of 1912 was 16·5 per 1000.

For facts, in detail, concerning Scotland and Ireland reference should be made to the Quarterly Returns of the Registrars-General for those parts of the United Kingdom.

#### Passenger Movement.

According to a Return issued by the Board of Trade it appears that with respect to the passenger movement between the United Kingdom and places out of Europe in the three months ended 31st March, 1913, the departures of passengers stated to be of British nationality exceeded the arrivals by 66,620 persons, an increase of 8·7 per cent. as compared with the corresponding period of the previous year. Of aliens those leaving exceeded those arriving by 19,901, the balance in the corresponding period of the previous year having been 11,646.

The passenger movement between the United Kingdom and the Continent of Europe showed a balance inward of 23,753 persons, British and aliens, in the first quarter of the year. The excess of aliens arriving for the Continent over those departing from the Continent in the first quarter was 26,114, against 14,919 in the corresponding quarter of 1912.

Thus the balance of the aggregate passenger movement in the quarter to and from all Countries was 62,768 outward.

#### Meteorology.\*

The weather of this quarter was of an unusually open character, frost being extremely rare and seldom of any noticeable severity. The mid-day temperatures were, as a rule, well above the normal, but the thermometer failed to rise to any exceptional height for the time of year, the absence of genial spring-like weather in March being quite a feature of the season. The quarter was unusually windy, most of the gales blowing from a Southerly to

---

\* Furnished by the Director of the Meteorological Office

Westerly quarter, and rainfall was frequent, the total amount being considerably in excess of the normal in all districts excepting the north of Scotland.

*January* was generally stormy and wet, and as the wind blew almost continuously from the Southward (South-East to South-West) the weather was, as a rule, unusually mild. Maximum shade temperatures of  $50^{\circ}$  and upwards were reported from time to time in all districts, but it was only at a few isolated places in the west and north that the thermometer exceeded  $55^{\circ}$ . Occasional sharp night frosts were, however, experienced, the sharpest occurring on the 13th and 14th, when the sheltered thermometer fell in many places at least  $12^{\circ}$  below the freezing point. On the surface of the grass readings below  $10^{\circ}$  were registered at several of the northern and central stations; at Newton Rigg, in Cumberland, the exposed thermometer on the morning of the 13th sank to zero. In the northern districts there were many places in which the thermometer on the 13th remained below the freezing point all day. The stormiest weather of the whole month occurred between the 9th and 12th, when a strong gale from the Southward and South-Eastward was experienced in all districts, with heavy rain, followed by severe snowstorms in all but the southern districts. In many localities in the north and east the accumulated snow lay in level places to a depth of between 12 and 18 ins., and was drifted by the gale to a depth of between 7 and 10 ft. In the London district the total amount of bright sunshine in January was in excess of the normal, but over the country generally there was a large deficiency, many places in the north reporting less than half the average amount. Rainfall was considerably in excess of the normal in all districts except the north of Scotland. In many parts of England and Ireland at least twice as much as the average amount was recorded, and at North Shields more than two and a half times as much.

*February* was at first mild, stormy, and wet, the conditions being, in fact, very similar to those which had prevailed throughout so large a portion of January. Severe gales from South and South-West were experienced on the 7th and 8th, the wind on the earlier date rising in squalls to a velocity of between 70 and 80 miles in many places, to 83 miles at Holyhead, and to 86 miles at Southport. After the 9th the weather became drier and more settled, but the thermometer continued above the normal, the highest readings being observed between the 10th and 12th, when shade maxima of  $55^{\circ}$  and upwards were recorded in most districts. On the 11th the thermometer at Ruthin and Jersey reached  $60^{\circ}$ , while on the 12th it again rose to  $60^{\circ}$  at Ruthin, and touched  $61^{\circ}$  at Sheepstor, on the edge of Dartmoor. Sharp frosts occurred, however, on the mornings of the 14th and 23rd; and on the 20th, when a keen North-East wind was blowing, the thermometer over a large portion of the country remained below  $40^{\circ}$  all day, the maximum reading at Buxton and Sheepstor being only one degree above the freezing point. Fog was very prevalent between the 10th and 15th; on the last-mentioned date a dense vapour canopy over London caused intense darkness throughout nearly the whole of the day. At a few places in the south of England the total duration of bright sunshine was above the average, but over the country generally it was deficient, many places in the north receiving less than two-thirds of the normal allowance. Rainfall was almost everywhere small; at a number of places, situated mainly in the western and northern parts of the kingdom, less than one-third of the average amount was collected.

*March* was extremely changeable, with frequent falls of rain in all districts, and an undue prevalence of strong winds, mainly from some Southerly quarter. Temperature was usually above the average, but there were no touches of spring-like warmth, the thermometer seldom exceeding  $55^{\circ}$  in any part of the country, and scarcely ever touching  $60^{\circ}$  even in the warmest districts. Ground frosts were of somewhat frequent occurrence, but in the screen the thermometer only once sank to a low March level, the minimum readings early on the 18th being as low as  $16^{\circ}$  at West Linton,  $19^{\circ}$  at Bellingham, and  $20^{\circ}$  at Fulbeck, Marchmont, and Crieff. Among the numerous gales which occurred during the month the most important were those of the 4th-6th, the 15th-18th, and the 20th-22nd. The gale of the 22nd was preceded by a smart thunder-storm which moved rapidly across England from west to east during the afternoon; a few hours later a violent gale from South to South-West swept over all the more southern districts, causing much structural damage, including the partial destruction of Worthing pier. In most parts of the country the total duration of bright sunshine in March was below the normal, but in the north-west of England it was slightly in excess. Rainfall was largely in excess of the average, some stations in the Midlands reporting at least two-and-a-half times as much, and Hereford more than three times as much as the normal quantity.

The *Mean Temperature* of the quarter was above the normal, the excess varying from nearly  $3^{\circ}$  in the east of England, and more than  $2^{\circ}$  in the south-eastern counties to less than half a degree in the east of Scotland and the south of Ireland. The period was, however, in all districts less mild than the corresponding quarter of 1912. The highest temperatures were recorded mainly on February 11th and 12th, or on March 7th, the thermometer rising on each occasion to  $60^{\circ}$  or a trifle above it at a few isolated places in the western and northern parts of the country. The lowest readings occurred in January, either on the 13th or 14th, or between the 22nd and 26th. On the earlier occasion the thermometer in the screen fell below  $15^{\circ}$  at many northern and central stations, the lowest readings reported being  $8^{\circ}$  at Mayfield (Staffs.),  $10^{\circ}$  at Newton Rigg, and  $11^{\circ}$  at Braemar and West Linton.

The *Rainfall* of the quarter was everywhere in excess of the average, both as regards frequency and amount, but the period was not as wet as in 1912. In most districts the total fall was at least 20 per cent. in excess of the normal, the wettest regions being the Midland Counties, with an excess of 44 per cent., England South-West (including South Wales) with an excess of 39 per cent., and Ireland South, with an excess of 36 per cent. In the north of Scotland the conditions were fairly normal, the excess amounting to only 2 per cent. The heaviest individual falls occurred respectively on January 4th in South Wales and the south-west of England; on January 10th heavy rain and snow combined in many parts of North Britain; on January 22nd in the south-western parts of the Kingdom; and on January 30th in the west of Scotland. In February and March there were few instances of the kind, and those mainly of a local character.

The *Bright Sunshine* of the quarter was below the average in all parts of the country, the deficiency amounting in many districts to at least half-an-hour per day. In the south-east of England, however, the

deficiency was small. The mean daily duration ranged from 3·0 hr. in the English Channel district, 2·6 hr. in England South-East, and 2·5 hr. in England East, to 1·8 hr. in Scotland West, and to 1·6 hr. in Scotland North.

#### COLONIAL AND FOREIGN CITIES.

The Registrar-General has been favoured with returns of vital statistics by the authorities of 27 of the principal Colonial and Foreign Cities. From these a summary has been constructed for the 13 weeks ended 29th March, 1913 (Table XV.).

#### RETURNS OF NOTIFIED CASES OF INFECTIOUS DISEASE.

At the request of the Local Government Board, and of the London County Council, and on their responsibility with respect to accuracy, tables have been inserted, in continuation of those published in previous returns, showing the numbers of cases of infectious sickness notified, under Act of Parliament, to the Sanitary Authorities of certain of the largest towns in England and Wales, during the 13 weeks ended 29th March, 1913 (*see* pages 21-26); and in the two following tables, these numbers have been reduced to rates per 1000 living in the several populations (*see* pages 27-32).

§ As published by the Board of Agriculture. The prices relate to Sunderland coal only.

TABLE V.—England and Wales and Registration Counties.—ESTIMATED POPULATION: MARRIAGES registered in the Quarter ended 31st Dec., 1912; BIRTHS

and DEATHS registered in the Quarter ended 31st March, 1913.

NOTE.—The Registration or Union Counties consist of groups of Registration Districts which are generally co-extensive with Poor Law Unions of the same names. The differences between Registration Counties and Administrative Counties are shown in Table 7 of Vol. II. of the Abstracts of the Census Returns, 1911 (Cd. 8259). The numbers of marriages, births, and deaths, are the numbers actually registered in each case.

REGISTRATION COUNTIES.	ESTIMATED POPULATION in the middle of 1912.*	MAR-RIAGES in the Quarter ended 31st Dec., 1912.	BIRTHS in Quarter ended 31st Mar., 1913.	DEATHS in Quarter ended 31st Mar., 1913.	The DEATHS registered include												REGISTRATION COUNTIES.

TABLE VII.—96 Great Towns; Greater London; 4 Scottish or Irish Towns.—Population; Births, Deaths, and Meteorology in the 13 Weeks ended 29th March, 1913.

NOTE.—The 96 Great Towns are those with populations exceeding 50,000 persons as the Census of 1911. The births here shown are those actually registered in the several towns. The deaths in London have been corrected as far as possible (1) by excluding deaths of all non-residents and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The deaths in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made. The number of towns is now increased by the inclusion of the City of Carlisle.

TOWNS.	ESTIMATED POPULATION in the middle of 1913.*	BIRTHS.	DEATHS.	The DEATHS registered include													MEAN TEMPERATURE in the Middle of the Month (On a scale of Fahr.).	RAIL- FALL (Inches).	TOWNS.

TABLE VIII.—96 Great Towns; Greater London; 4 Scottish or Irish Towns.—Birth-rate, Death-rate, and Analysis of Mortality in the 13 Weeks ended 29th March, 1913.

NOTE.—The 96 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The birth-rate is based upon births actually registered in the several towns. The death-rate in London has been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The death-rates in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made. The number of towns is now increased by the inclusion of the City of Carlisle.

TOWNS.		ANNUAL RATE PER 1000 PERSONS LIVING.										RATE PER 1000 BIRTHS.		ANNUAL DEATH RATE per 1000 living.		PERCENTAGE of Total Deaths.		TOWNS.

\* Uncorrected for deaths of non-residents.

TABLE IX.—One hundred and forty-five Smaller Towns.—Population; Births and Deaths in the QUARTER ended 31st March, 1913.  
NOTE.—The 145 Smaller Towns are those with populations of 20,000 but not exceeding 50,000 at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths have been corrected as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying institutions. With regard to towns in the Outer Ring, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made. The number of towns is now reduced by the inclusion of the City of Carlisle in the group of Great Towns.

TOWNS.	The DEATHS registered in the Quarter include										Deaths under 1 year to 1000 Births.		TOWNS.

No. 258.] **Marriages**—*January, February, March, 1913.*  
**Births and Deaths**—*April, May, June, 1913.*

[Price 6d.]

NOTE.—The figures in this publication are tabulated mainly from statistical Returns furnished by the local Registrars, and may not be found to correspond exactly with the authoritative figures for the whole year to be published later in the Annual Report.

*General Register Office, Somerset House,  
31st July, 1913.*

**ENGLAND AND WALES.**

The figures in this Return are based upon the BIRTHS and DEATHS registered in the 1,996 registration sub-districts of England and Wales in the three months ended 30th June, 1913; and the MARRIAGES in 15,919 churches or chapels, in 16,283 registered places of worship unconnected with the Established Church, and in 634 Superintendent Registrars' Offices, in the three months ended 31st March, 1913.

The births registered during the three months ended 30th June, 1913 numbered 227,012 and the deaths 121,745; the number of persons married during the three months ended 31st March, 1913 was 121,728.

**Marriages.**

The number of persons married during the *first* quarter of 1913 corresponds to an annual rate of 13·4 per 1000 of the population, which is estimated to amount to 36,919,339 persons at the middle of this year; this is 2·4 per 1000 above the mean marriage-rate in the ten preceding first quarters, and also 3·6 per 1000 above the rate recorded in the first quarter of 1912.

**Births.**

The births registered in the *second* quarter of 1913 correspond to a rate of 24·7 annually per 1000 of the population, which is 2·4 per 1000 below the mean birth-rate in the ten preceding second quarters, but 0·8 per 1000 above the rate in the corresponding period of 1912.

**Natural Increase of Population.**

The natural increase of population in England and Wales last quarter by excess of births over deaths was 105,267, against 119,154, 105,812, and 102,302 in the second quarters of 1910, 1911, and 1912, respectively.

## Deaths.

The deaths registered in England and Wales last quarter correspond to an annual rate of 13·2 per 1000 persons living ; this rate is 0·9 per 1000 below the mean rate in the ten preceding second quarters, but 0·5 above the rate recorded in the corresponding period of 1912.

The 121,745 registered deaths included 63,367 of males and 58,378 of females, the death-rate among males being 14·2, and that among females 12·3, per 1000 of the estimated populations of the respective sexes. Compared with the average for each sex in the ten preceding second quarters, the death-rate of males showed a decrease of 0·9, and that of females a decrease of 0·8. Out of equal numbers living, the deaths of males were to those of females as 116 is to 100, the mean proportion in the second quarters of the ten preceding years being the same.

### *Mortality at Different Ages.*

Infantile mortality, measured by the proportion of deaths under one year of age to registered births, was equal to 89 per 1000, being 11 per 1000 below the average in the ten preceding second quarters.

The mortality among persons aged between one year and sixty-five years was at the annual rate of 7·4 per 1000 of the estimated population at this group of ages.

Among persons aged sixty-five years and upwards the mortality was at the annual rate of 80·1 per 1000 of the estimated population at this group of ages.

### *Urban and Rural Mortality.*

Table III. shows the birth-rates, the death-rates from all causes, from the principal epidemic diseases and from violence, and the death-rates at certain age groups, together with the proportion of inquest cases, of uncertified deaths, and of deaths in public institutions in England and Wales during the *second* quarter of 1913, compared with the corresponding average rates in the *second* quarters of the ten preceding years, and also with the rates last quarter in the 96 great towns, in the 145 smaller towns, and in the remainder of England and Wales.

In the country as a whole the mortality from measles last quarter was slightly below the average ; that from enteric fever, scarlet fever, and whooping-cough was little more than half the average, and that from diphtheria about three-fourths of the average.

The highest death-rates per 1000 persons living from the several epidemic diseases among the 96 great towns last quarter were as follows :—from *enteric fever*, 0·15 in Gillingham, 0·16 in St. Helens and in Warrington, 0·19 in Rotherham, and 0·21 in Stockport ; from *measles*, 1·19 in Gloucester, 1·35 in Salford, 1·40 in Smethwick, 1·64 in Wolverhampton, 2·18 in St. Helens, 2·21 in West Bromwich, and 3·56 in Walsall ; from *scarlet fever*, 0·20 in Birmingham and in Preston, 0·22 in Eastbourne, 0·32 in Smethwick, 0·33 in Tynemouth, 0·41 in Newport (Mon.), and 0·48 in St. Helens ; from *whooping-cough*, 0·61 in Aberdare, 0·67 in Newcastle-on-Tyne, 0·69 in Stockton-on-Tees, 0·81 in Brighton, 0·85 in Stoke-on-Trent, and 0·89 in Bootle ; and from *diphtheria*, 0·28 in St. Helens, 0·29 in Eastbourne, 0·30 in Portsmouth, 0·39 in Stoke on Trent, 0·48 in Gloucester and 0·49

in Cambridge. The highest death-rates per 1000 births from *diarrhœa and enteritis* among children under 2 years of age were 18·33 in Middlesbrough, 19·67 in Wolverhampton, 20·38 in Walsall, 21·70 in Stoke on Trent, 22·06 in Dudley and 39·95 in Preston.

### *Watering Places and Summer Resorts.*

The deaths registered last quarter from all causes, and from each of the more important epidemic diseases, in those urban districts which are most nearly coterminous with our chief watering places, are shown in Table XV. For purposes of comparison the populations at the recent census are also shown.

### **UNITED KINGDOM.**

The POPULATION of the UNITED KINGDOM in the middle of 1913 is estimated at 46,032,115 persons; that of England and Wales at 36,919,339, that of Scotland at 4,733,700, and that of Ireland at 4,379,076.

In the United Kingdom 285,838 *births* and 159,881 *deaths* were registered in the three months ended 30st June, 1913. The natural increase of population was, therefore, 125,957. The number of *persons married* in the United Kingdom during the quarter ended 31st March, 1913, was 148,806.

The birth-rate in the United Kingdom in the *second* quarter of 1913 was 24·9, and the death-rate 13·9, per 1000 of the estimated population. The marriage-rate in the *first* quarter of 1913 was 13·0 per 1000.

For facts, in detail, concerning Scotland and Ireland reference should be made to the Quarterly Returns of the Registrars-General for those parts of the United Kingdom.

### **Passenger Movement.**

According to a Return issued by the Board of Trade it appears that with respect to the passenger movement between the United Kingdom and places out of Europe in the three months ended 30th June, 1913, the departures of passengers stated to be of British nationality exceeded the arrivals by 91,224 persons, an increase of 17 per cent. as compared with the corresponding period of the previous year. Of aliens those leaving exceeded those arriving by 26,119, the balance in the corresponding period of the previous year having been 4,953.

The passenger movement between the United Kingdom and the Continent of Europe showed a balance inward of 74,115 persons, British and aliens, in the second quarter of the year. The excess of aliens arriving from the Continent over those departing for the Continent in the second quarter was 56,570 against 26,426 in the corresponding quarter of 1912.

Thus the balance of the aggregate passenger movement in the quarter to and from all Countries was 43,228 outward.

### **COLONIAL AND FOREIGN CITIES.**

The Registrar-General has been favoured with returns of vital statistics by the authorities of 28 of the principal Colonial and Foreign Cities. From these a summary has been constructed for the 13 weeks ended 28th June, 1913 (Table XVI.).

## RETURNS OF NOTIFIED CASES OF INFECTIOUS DISEASE.

At the request of the Local Government Board, and of the London County Council, and on their responsibility with respect to accuracy, tables have been inserted, in continuation of those published in previous returns, showing the numbers of cases of infectious sickness notified, under Act of Parliament, to the Sanitary Authorities of certain of the largest towns in England and Wales, during the 13 weeks ended 28th June, 1913 (*see* pages 21-26); and in the two following tables, these numbers have been reduced to rates per 1000 living in the several populations (*see* pages 27-32).

### Meteorology.\*

Weather of a very variable character was experienced during the second quarter of the year. As a general rule the day temperature was below the normal, but there were occasions in May and June when readings considerably in excess were registered over wide areas. The only frost of note occurred in the middle of April, and it was of very brief duration. Though there was a good deal of cold in May, it was not of the intensity usually associated with the season. Rainfall, both quantity and frequency, was rather less than usual in the extreme eastern counties of England, and normal over the south-eastern counties, but all other parts of the British Isles returned an excess. Bright sunshine was deficient all over the kingdom. Some rather severe gales for the time of year were felt in various districts in each month.

*April* was divided between two types of weather conditions. During the first ten days the country was influenced mainly by an anticyclonic distribution of pressure. Owing to the existence of a disturbance over the western portion of the Continent strong or high North-Easterly winds were experienced on several days in many parts of England, but there was an almost entire absence of gale force. Over the country generally this was a dry spell, more particularly in the northern and western districts, no rain falling on several successive days, at St. Andrews and Cahir on nine days, and at Ballinacurra there was only one trifling shower in eleven days. The dry area did not include South-Eastern England, the region nearest to the Continental depression, where there were considerable rainfalls, ranging up to  $\frac{3}{4}$  in. at Folkestone, and more than an inch at Sandgate on the 3rd. A sudden and very striking change was brought about on the 11th, when a disturbance from the Greenland region moved down across this country at an unusually rapid rate. It was accompanied by bitterly cold weather, the afternoon temperature on that day failing to touch 40° in numerous localities, a maximum of only 35° as far south as Bawtry (Notts.), and 33° at Harrogate, while in the night of the 12th there was a severe frost, the shade temperature sinking to 25° and under at a number of places, as low as 19° at Wokingham, and 18° at Balmoral. The passage of the disturbance was marked also by a snowstorm, which was nearly as heavy as the heaviest of the preceding winter. Though the snow was melting quickly many localities reported a depth of from three to six inches on the following day. With the approach of a very deep cyclonic system from the upper region of the Atlantic the most stormy days of the month set in on the 14th. Daily until the 20th a Southerly to Westerly gale or a strong gale blew in various districts, accompanied by rain, and locally by snow

---

\* Furnished by the Director of the Meteorological Office.

or hail showers. At Seathwaite the rainfall on the 14th exceeded  $3\frac{1}{2}$  in., and on the following day there were heavy falls over the country generally, exceeding an inch at a number of lowland stations, and from 3 in. to  $3\frac{1}{2}$  in. round Snowdon. The closing week was very unsettled, with heavy rains and a good deal of wind, a strong gale at times locally, and on the 26th squalls attaining a velocity of 68 miles per hour were registered at Quilty, and of 72 miles at Pendennis. The heavy rains of this day ranged up to more than 2 in. in Cumberland and about Dartmoor,  $2\frac{3}{4}$  in. at Princetown. Nearly the whole of England was involved in a thunderstorm on the evening of the 29th, very severe in many places, and causing more or less material damage locally. The duration of bright sunshine for the month was nearly everywhere less than the average, Guernsey returning only 57 per cent. of its usual record, Jersey and Torquay 64 per cent., and Tenby 67 per cent. In various neighbourhoods the month's precipitation was from twice to three times the normal quantity.

*May* was a very variable month, with alternations of anticyclonic and cyclonic systems over or in the vicinity of this country. Through the first three weeks a very breezy type ruled, high winds being felt in one or more districts almost every day, and gale force was frequent, affecting an extensive area on the 8th, when the strength of a whole gale occurred on the Donegal Coast, and gusts at the rate of 70 miles an hour were registered at Pendennis. This windy period was rather cold, the lowest temperatures occurring round the 6th and 7th, afternoon maxima below  $50^{\circ}$  being numerous, in several instances as low as  $42^{\circ}$  to  $45^{\circ}$ . At many stations the temperature in the shade fell to or below the freezing point, to  $29^{\circ}$  at Mayfield (Staffs.) and Welshpool, and  $27^{\circ}$  at Wokingham. In the closing week there was a sudden change from cold to heat, and from the 25th to the 30th day temperatures of  $80^{\circ}$  and above were numerous over England,  $83^{\circ}$  and  $84^{\circ}$  in and around the Metropolis. High night readings were registered in many places at this time, up to  $62^{\circ}$  at Dover and Eye (Peterborough). The month's rainfall was irregular in its distribution, though as a rule it was in excess of the normal. There were during the early days sporadic thunderstorms and some heavy rainstorms, more than 2 in. at Princetown on the 7th, and  $2\frac{3}{4}$  in. at Crathes on the 9th, but for a fortnight or more from the latter date the Eastern and Southern districts had very dry weather, no rain falling on 19 consecutive days at Norwich and Temple Bruer. From the 26th to the end thunderstorms were extensively prevalent daily, often violent and in places destructive, attended by hail in many instances, but as a whole the rainfall was very moderate. The storm of the 29th-30th, however, brought flooding rains to some southern districts. On the breaking of a thunderstorm at Warlingham (Surrey) on the 27th, there was a sudden fall of  $13^{\circ}$  in the temperature. Lack of sunshine was again noticeable, except at a few stations in the south. Stonyhurst and Valencia returned only 69 per cent. of the average duration, Southport, Markree Castle and Phoenix Park 71 per cent., and Durham and Stornoway 72 per cent.

*June* was another very variable period. From the 6th to the 10th was a boisterous spell, with a gale, to a strong or whole gale from between South and West in several districts, and on the 10th gusts as high as 60 miles per hour at Shields, 63 miles at Southport, and 64 miles at Aberdeen. The rest of the month had very little wind. For midsummer there were singularly few thunderstorms, and of those recorded only a very small proportion appear to have been heavy, the principal one being on the 17th over Eastern England,

when the rainfall amounted to more than 2 in. at Brampton Grange, and nearly 3 in. at Great Paxton. With this exception the heavy rainstorms of the month were confined almost wholly to the higher lands in the western regions, where on some days the measurements were between four and five inches. Generally over the lowlands the weather was of a drougthy character, a considerable portion of Southern England receiving less than  $\frac{1}{2}$  in. of rain, some localities less than  $\frac{1}{4}$  in. At Wantage rain fell on only four days, and a number of stations returned five or six days. Temperature was above the normal in the eastern districts, below it in the west. On the 16th and 17th, and again on the 29th and 30th day temperatures in the eighties were experienced at many stations in England, as high as 88° at Wantage, and 87° at Greenwich and Wimbledon on the former occasion, and 83° at Ross and Wilton House (Salisbury) on the latter. A maximum of 80° was reached on the 16th in Scotland, at Ruthwell, and on the 30th in Ireland, at Lisburn. In the night of the 16th–17th several parts of England had minimum temperatures from 60° to 63°, but at other times there were very few minima as low as 40°. The duration of bright sunshine was deficient in most districts, being only 58 per cent. of the normal at Stonyhurst, 68 at Stornoway, and 73 per cent. at Markree Castle.

The *Mean Temperature* of the quarter was above the normal over the North-East and East of England, normal over the North of Scotland and the Midland and South-Eastern Counties of England, deficient in other districts, by  $1\frac{1}{4}$ ° over Ireland. As will have been gathered from the monthly notes given above the range of temperature was large, maxima above 80° occurring in May and in June, and minima below the freezing point in April and in May. The extreme values were 88° registered at Wantage on June 16th, and 18° registered at Balmoral on April 13th. Compared with the corresponding quarter of 1912 the mean values were lower in all districts, by as much as  $2\frac{1}{2}$ ° in the English Channel.

The *Rainfall* of the quarter was above the average excepting in South-Eastern and Eastern England. Over the eastern half of Britain the excess was small, less than  $\frac{3}{4}$  in., but in the western districts it was 2 in. or more, as much as 4 in. over Southern Ireland. From 87 in the east of England, and 100 in the South-Eastern Counties the percentage values ranged up to 132 in South-Western England, 140 in Ireland North, and 151 in Ireland South. The heaviest rainstorm of the quarter occurred on June 9th, in the western high lands, when more than 4 in. fell at Seathwaite and on the slopes of Snowdon. At Crathes on May 8th–9th there was a rainstorm which lasted over 36 hours, the yield of water being 4·4 in. The returns show that the quantity of rain deposited in the large towns during the quarter ranged from 3·9 in. at Southend, 4·1 in. in London, 4·2 in. at Norwich, and 4·3 in. at Edinburgh to 9·2 in. at Belfast, 9·6 in. at Glasgow, 9·9 in. at Newport (Mon.), 10 in. at Cardiff, 11·5 in. at Burnley, 11·6 in. at Bolton, and 12·2 in. at Swansea.

The duration of *Bright Sunshine* during the quarter was less than the normal all over the Kingdom, the deficiency in the western districts being from an hour to  $1\frac{3}{4}$  hour per day. South-Eastern England had the best record, with 92 per cent. of the normal, the Eastern Counties following with 91 per cent., and Eastern Scotland 90 per cent., the values ranging down to 78 per cent. for the English Channel, and 76 per cent. for Western Scotland. The mean daily duration ranged from 5·8 hours in Eastern England to 4·3 hours in the north of Scotland.

TABLE V.—**England and Wales and Registration Counties.**—ESTIMATED POPULATION: MARRIAGES registered in the Quarter ended 31st March, 1913; BIRTHS and DEATHS registered in the Quarter ended 30th June, 1913.

NOTE.—The Registration or Union Counties consist of groups of Registration Districts which are generally co-extensive with Poor Law Unions of the same names. The differences between Registration Counties and Administrative Counties are shown in Table 7 of Vol. II. of the Abstracts of the Census Returns, 1911 (Cd. 8259). The numbers of marriages, births, and deaths, are the numbers actually registered in each case.

TABLE VII.—96 Great Towns; Greater London; 4 Scottish or Irish Towns.—Population; Births, Deaths, and Meteorology in the 13 Weeks ended 28th June, 1913.

NOTE.—The 96 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths in London have been corrected far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The deaths in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

TOWNS.	Cols.	ESTIMATED POPULATION in the middle of 1913.*	BIRTHS.	DEATHS.	The DEATHS registered include													MEAN TEMPERATURE (Dee. to Febr.) +	RAIN-FALL (Inches.) +	TOWNS.

\* The values for Mean Temperature and Rainfall relate to the calendar quarter.

† The figures for Edinburg and Glasgow relate to the calendar quarter. The deaths are corrected throughout by deduction of deaths of non-residents domiciled in Scotland, and by addition of deaths of residents domiciled elsewhere in Scotland.

‡ Excluding deaths of persons admitted into public institutions from without the boundaries of Dublin and Belfast respectively.

\* Phoenix Park.

<sup>b</sup> Fitzwilliam Square.

TABLE VIII.—96 Great Towns; Greater London; 4 Scottish or Irish Towns.—Birth-rate, Death-rate, and Analysis of Mortality in the 13 Weeks ended 28th June, 1913.

NOTE.—The 96 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The birth-rate is based upon births actually registered in the several towns. The death-rate in London has been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The death-rates in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transference deaths occurring in any part of Greater London having been made.

\* Uncorrected for deaths of non-residents.

TABLE IX.—One hundred and forty-five smaller towns.—Population: Births and Deaths in the QUARTER ended 30th June, 1913.

NOTE.—The 145 smaller towns are those with populations of 20,000 but not exceeding 50,000 at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths have been corrected as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying institutions. With regard to towns in the Outer Ring, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

TABLE XIV.—COUNTY OF LONDON.—Births, Deaths, and Death-Rates in London, and in the Metropolitan Boroughs during the 13 WEEKS ended 28th June, 1913. (The births in this table are those actually registered in the several Metropolitan Boroughs. The Deaths are, so far as concerns London as a whole, corrected to the extent indicated at the head of Table VII. As between individual boroughs, however, correction is complete.)

BOROUGH.	Deaths from										ANNUAL DEATH-RATES PER 1000 LIVING.										RATE PER 1000 BIRTHS.		
	Deaths of Infants under 1 Year of Age.										ALL CAUSES.	Enteric Fever.	Small-pox.	Measles.	Scarlet Fever.	Whooping cough.	Diphtheria.	Pulmonary Tuberculosis.	Diarrhoea and Enteritis (under 2 years).	Total deaths under 1 Year.			
	Deaths of Infants under 1 Year of Age.

No. 259.] **Marriages**—April, May, June, 1913. [Price 6d.  
**Births and Deaths**—July, August, September, 1913.

---

NOTE.—The figures in this publication are tabulated mainly from statistical Returns furnished by the local Registrars, and may not be found to correspond exactly with the authoritative figures for the whole year to be published later in the Annual Report.

*General Register Office, Somerset House,  
31st October, 1913.*

**ENGLAND AND WALES.**

The figures in this Return are based upon the BIRTHS and DEATHS registered in the 1,987 registration sub-districts of England and Wales in the three months ended 30th September, 1913; and the MARRIAGES in 15,927 churches or chapels, in 16,355 registered places of worship unconnected with the Established Church, and in 634 Superintendent Registrars' Offices, in the three months ended 30th June, 1913.

The births registered during the three months ended 30th September, 1913, numbered 225,240 and the deaths 113,455; the number of persons married during the three months ended 30th June, 1913, was 131,584.

**Marriages.**

The number of persons married during the *second* quarter of 1913 corresponds to an annual rate of 14·3 per 1000 of the population, which is estimated to amount to 36,919,339 persons at the middle of this year; this is 2·2 per 1000 below the mean marriage-rate in the ten preceding second quarters, and 2·0 per 1000 below the rate recorded in the second quarter of 1912.

**Births.**

The births registered in the *third* quarter of 1913 correspond to a rate of 24·2 annually per 1000 of the population, which is 2·2 per 1000 below the mean birth-rate in the ten preceding third quarters, but 0·4 per 1000 above the rate in the corresponding period of 1912.

**Natural Increase of Population.**

The natural increase of population in England and Wales last quarter by excess of births over deaths was 111,785, against 122,997, 81,557, and 117,576 in the third quarters of 1910, 1911, and 1912, respectively.

## Deaths.

The deaths registered in England and Wales last quarter correspond to an annual rate of 12·2 per 1000 persons living ; this rate is 1·2 per 1000 below the mean rate in the ten preceding third quarters, but 1·2 above the rate recorded in the corresponding period of 1912.

The 113,455 registered deaths included 59,478 of males and 53,977 of females, the death-rate among males being 13·2, and that among females 11·2, per 1000 of the estimated populations of the respective sexes. Compared with the average for each sex in the ten preceding third quarters, the death-rate of males showed a decrease of 1·3, and that of females a decrease of 1·1. Out of equal numbers living, the deaths of males were to those of females as 118 is to 100, the mean proportion in the third quarters of the ten preceding years being the same.

### *Mortality at Different Ages.*

Infantile mortality, measured by the proportion of deaths under one year of age to registered births, was equal to 112 per 1000, being 24 per 1000 below the average in the ten preceding third quarters.

The mortality among persons aged between one year and sixty-five years was at the annual rate of 6·6 per 1000 of the estimated population at this group of ages.

Among persons aged sixty-five years and upwards the mortality was at the annual rate of 64·1 per 1000 of the estimated population at this group of ages.

### *Urban and Rural Mortality.*

Table III. shows the birth-rates, the death-rates from all causes, from the principal epidemic diseases and from violence, and the death-rates at certain age groups, together with the proportion of inquest cases, of uncertified deaths, and of deaths in public institutions in England and Wales during the *third* quarter of 1913, compared with the corresponding average rates in the *third* quarters of the ten preceding years, and also with the rates last quarter in the 96 great towns, in the 145 smaller towns, and in the remainder of England and Wales.

In the country as a whole the mortality from diphtheria last quarter was slightly below the average ; that from enteric fever was less than half the average, and that from measles, scarlet fever, and whooping-cough about two-thirds of the average.

The highest death-rates per 1000 persons living from the several epidemic diseases among the 96 great towns last quarter were as follows :—from *enteric fever*, 0·12 in Portsmouth and in West Hartlepool, 0·13 in Wolverhampton, and 0·15 in Hull and in Stockton on Tees ; from *measles*, 0·60 in Walsall, 0·66 in Sunderland, 1·39 in West Bromwich, 1·68 in Aberdare, 1·89 in Stoke on Trent, and 2·02 in Dudley ; from *scarlet fever*, 0·20 in St. Helens, 0·22 in Sheffield, 0·23 in Dudley, and 0·27 in Bury and in Newport (Mon.) ; from *whooping cough*, 0·39 in Stoke on Trent and in Hull, 0·41 in Bolton, 0·44 in West Hartlepool, and 0·50 in Bootle ; and from *diphtheria*, 0·24 in Gloucester, in Preston, and in Cardiff, 0·25 in Tottenham and in Barrow in Furness, and 0·35 in Stoke on Trent. The highest death-rates per 1000 births from *diarrhœa* and *enteritis*

among children under 2 years of age were 120·88 in Bootle, 128·24 in Wigan, 129·15 in Rhondda, 130·64 in Burnley, 149·60 in Birkenhead, and 154·06 in Aberdare. In accordance with precedent special tables relating to summer mortality from diarrhoea and enteritis have been inserted in the present Return (Tables XV. and XVI.).

#### UNITED KINGDOM.

The POPULATION of the UNITED KINGDOM in the middle of 1913 is estimated at 46,032,115 persons; that of England and Wales at 36,919,339, that of Scotland at 4,733,700, and that of Ireland at 4,379,076.

In the United Kingdom 279,438 *births* and 146,043 *deaths* were registered in the three months ended 30th September, 1913. The natural increase of population was, therefore, 133,395. The number of *persons married* in the United Kingdom during the quarter ended 30th June, 1913, was 159,808.

The birth-rate in the United Kingdom in the *third* quarter of 1913 was 24·1, and the death-rate 12·6, per 1000 of the estimated population. The marriage-rate in the *second* quarter of 1913 was 13·9 per 1000.

For facts, in detail, concerning Scotland and Ireland reference should be made to the Quarterly Returns of the Registrars-General of those parts of the United Kingdom.

#### Passenger Movement.

According to a Return issued by the Board of Trade it appears that with respect to the passenger movement between the United Kingdom and places out of Europe in the three months ended 30th September, 1913, the departures of passengers stated to be of British nationality exceeded the arrivals by 65,123 persons, a decrease of 22 per cent. as compared with the corresponding period of the previous year. Of aliens those leaving exceeded those arriving by 38,097, the balance in the corresponding period of the previous year having been 29,483.

The passenger movement between the United Kingdom and the Continent of Europe showed a balance inward of 46,887 persons, British and aliens, in the third quarter of the year. The excess of aliens arriving from the Continent over those departing for the Continent in the third quarter was 43,993 against 33,064 in the corresponding quarter of 1912.

Thus the balance of the aggregate passenger movement in the quarter to and from all Countries was 56,333 outward.

#### COLONIAL AND FOREIGN CITIES.

The Registrar-General has been favoured with returns of vital statistics by the authorities of 28 of the principal Colonial and Foreign Cities. From these a summary has been constructed for the 13 weeks ended 27th September, 1913 (Table XVII.).

#### RETURNS OF NOTIFIED CASES OF INFECTIOUS DISEASE.

At the request of the Local Government Board, and of the London County Council, and on their responsibility with respect to accuracy, tables have been inserted, in continuation of those published in previous returns, showing the numbers of cases of infectious sickness

notified, under Act of Parliament, to the Sanitary Authorities of certain of the largest towns in England and Wales, during the 13 weeks ended 27th September, 1913 (*see* pages 21-26); and in the two following tables, these numbers have been reduced to rates per 1000 living in the several populations (*see* pages 27-32).

### **Meteorology.\***

Contrary to usual experience the weather during the third quarter of 1913 was much finer in the western than in the eastern portion of the United Kingdom. Even in the former districts the presence of more than the ordinary amount of bright sunshine was unattended by anything in the nature of abnormal summer warmth, shade temperatures as high as 80° being extremely rare. In September most districts experienced at one time or another heavy falls of rain, accompanied in many instances by thunderstorms of considerable severity. As a whole the quarter was, however, extremely dry. In the west and south-west of England a partial drought which had set in early in June, and locally still earlier, continued until very nearly the end of August, the total rainfall in a period of about 100 days being in some places very little over an inch. Over the south-eastern quarter of the country September was distinguished by a singular absence of gales or strong winds, and also by an almost entire absence of frost, the mean of the night temperatures observed in and around London being the highest recorded in the first autumnal month since the year 1880.

In *July* the weather was mostly fine in Ireland and Scotland, but unusually cloudy and cool over England, the total duration of bright sunshine at some of the eastern and central stations being considerably less than half the average. The opening week witnessed the withdrawal to the Atlantic of an anticyclone which had previously covered the whole of these islands, and the gradual extension of a large and complex area of low pressure from the northern and central parts of the Continent. Variable winds and fair weather were therefore succeeded by freshening Northerly breezes, with showers in all but the south-western districts. Thunderstorms occurred in many parts of England, and were accompanied locally by heavy falls of rain, more than an inch being recorded at several stations on the 6th, and at many places in the south-east on the 10th. Storms were also experienced on the 14th, with further local downpours in the east and south-east; at Mayfield, Sussex, during the night of the 14th-15th a violent thunderstorm was accompanied by a fall of rain amounting to over 3 in. The prevailing winds at the time were mainly from the Westward or South-westward, but after the middle of the month, when a large anticyclone extended over our western and northern districts from the Atlantic, a general shift to North and North-east took place, with fair weather in the west, but a continuance of showery weather in the east. On the night of the 29th, when a small cyclonic disturbance advanced northwards from the Bay of Biscay, a severe thunderstorm was experienced in Guernsey (where about 2 in. of rain fell), and on the following morning sharp squalls of wind from the Eastward were experienced on the Cornish coasts. The highest temperatures of the month occurred between the 27th and 29th, when the thermometer rose to 80° and upwards in several scattered places, and touched 83° at Killerton, near Exeter.

---

\* Furnished by the Director of the Meteorological Office.

*August* was upon the whole fair and dry, with more than the average amount of bright sunshine in Ireland and Scotland, but with a preponderance of cloudy weather over the midland and south-eastern counties of England. Anticyclonic conditions prevailed during the first eight or nine days, but the thermometer seldom rose to any high summer level, the only shade readings as high as  $80^{\circ}$  being recorded quite sporadically between the 2nd and 4th when the thermometer rose to  $83^{\circ}$  at Belper and Rugby, and to  $84^{\circ}$  at Hodsock, near Worksop. After the 9th, when a large area of low barometrical pressure expanded southwards from Northern Europe, the weather became less settled, but over the country generally the rainfall was for a time slight and very partial. At Bath a fall of 1.0 in. occurred, however, on the 9th, and at Scilly as much as 1.5 occurred on the 11th. After the 20th a more general break in the weather was experienced, the change being due to the extension of a large cyclonic disturbance from the Icelandic region. Rain now fell in all districts, heavily in Cumberland, the amount on the 21st being as large as 2.0 in. at Aspatria and 4.3 in. at Seathwaite. No serious fall of anything like a general character occurred, however, until very nearly the end of the month, when a depression extended northwards from the Bay of Biscay, occasioning a very heavy downpour on the south coast of England, and smaller quantities of rain in most other parts of the country. On the 31st more than an inch and a half was collected at several stations in Kent and Sussex, and as much as two inches and a half at Worthing. During a brief interval of fine anticyclonic weather between the 26th and 28th the thermometer rose to  $80^{\circ}$  and upwards in many parts of England, and touched  $83^{\circ}$  at Woking and  $84^{\circ}$  at Matfield, Sussex.

*September* was changeable throughout, and in the earlier half of the month scarcely any district escaped without at least two or three heavy falls of rain, accompanied in some places by thunderstorms of considerable severity. The worst weather appears to have occurred on the 4th and 5th, and between the 12th and 17th. On the former occasion the heaviest rains occurred in South Wales and the south-west of England; at Princetown, during a severe thunderstorm on the morning of the 4th, nearly an inch and three quarters of rain fell in the space of an hour. Around the middle of the month the rain was, as a rule, heaviest in Ireland, Wales, and the neighbouring English districts, but on the 16th a torrential downpour occurred at Newcastle-on-Tyne, while on the following day some very heavy falls were experienced in the North Midlands. In the latter part of the month the weather, though still very changeable, was less rainy, but considerable falls occurred in some parts of Ireland on the 22nd, 24th, and 27th, and in the north-west of England on the 26th. Temperature was usually above its average level, more especially in the night time, the highest readings being observed around the 27th, when the thermometer in the shade rose above  $75^{\circ}$  in many parts of the Kingdom, and touched  $82^{\circ}$  at Whitby. On the night of the 26th–27th the thermometer in several places remained above  $60^{\circ}$ , and at Manchester it did not sink below  $65^{\circ}$ . The sunshine of the month was again very deficient, many districts recording less than two-thirds of the average duration.

The *Mean Temperature* of the quarter was slightly above the average in the western and northern districts generally, and also in the Midland Counties, but was a trifle below it in the south and east. The highest readings, which were very moderate for the season, were recorded at various times in the different districts, but

mostly between July 27th and 29th or between August 2nd-4th or 28th-30th. No shade temperature as high as  $85^{\circ}$  was observed in any part of the United Kingdom, the highest value reported being one of  $84^{\circ}$  at Hodsock, near Worksop, on August 4th, and at Matfield on August 28th. At a number of places situated in nearly all districts the thermometer did not once reach  $80^{\circ}$ . The lowest temperatures of the quarter occurred on or about September 8th, or between September 15th and 18th, when the sheltered thermometer fell below  $35^{\circ}$  at many inland stations in England, and below the freezing point in some parts of Central Scotland. On September 7th a reading of  $27^{\circ}$  was registered at Kingussie, and a reading of  $28^{\circ}$  at West Linton, Peeblesshire.

The *Rainfall* of the quarter amounted in most districts to considerably less than two-thirds, and in the west and north of Scotland to less than half the average. Observations extending back to the year 1878 show that in Ireland, Scotland, and the north-west of England the quarter was, for the corresponding time of year, the driest on record. Between July 19th and August 22nd there were a large number of places in which no measurable quantity of rain was experienced for at least three weeks, the period of absolute drought extending to as many as 29 days at Exmouth, 30 days at Teignmouth, and 34 days at South Hanningfield, Essex. In the earlier half of September most places experienced at least one or two very heavy falls, but it was only in the western districts that the total for the month was in excess of the average.

The duration of *Bright Sunshine* for the quarter was above the average in most of the western districts, the excess amounting to 5 per cent. in the north-west of England and to 8 per cent. in the north of Ireland. Elsewhere the duration was below the average, the greatest deficiency occurring in the Midland Counties, where less than three-fourths of the normal amount was recorded. The mean daily duration ranged from a little over 6 hours in the Scilly and Channel Islands and about  $5\frac{1}{2}$  hours in Wales and the west of England to 4 hours or rather less in the English Midlands and the north and east of Scotland.

\* The Standardized Death-rates represent the Crude Death-rates multiplied by the respective Standardizing Factors in order to make correction for differences of sex and age constitution of the several populations in 1911 as compared with that of England and Wales in 1901. A description of the method of constructing these Factors is to be found in the Annual Report for 1911, p. xxix.

§ No quotations during the quarter.

† As published by the Board of Agriculture.

‡ The prices relate to Sunderland coal only.

TABLE V.—**England and Wales and Registration Counties.**—ESTIMATED POPULATION: MARRIAGES registered in the Quarter ended 30th June 1913; BIRTHS and DEATHS registered in the Quarter ended 30th September, 1913.

NOTE.—The Registration or Union Counties consist of groups of Registration Districts which are generally co-extensive with Poor Law Unions of the same names. The differences between Registration Counties and Administrative Counties are shown in Table 7 of Vol. II. of the Abstracts of the Census Returns, 1911 (Cd. 6239). The numbers of marriages, births, and deaths, are the numbers actually registered in each case.

TABLE VII.—96 Great Towns; Greater London; 4 Scottish or Irish Towns.—Population; Births, Deaths, and Meteorology in the 13 Weeks ended 27th September, 1913.

NOTE.—The 96 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths in London have been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The deaths in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

† The values for Mean Temperature and Rainfall relate to the calendar quarter.

\* Phoenix Park.

† The figures for Edinburgh and Glasgow relate to the calendar quarter. The deaths are corrected throughout by deduction of deaths of non-residents domiciled in Scotland, and by addition of deaths of residents registered elsewhere in Scotland.

† Excluding deaths of persons admitted into public institutions from without the boundaries of Dublin and Belfast respectively.

TABLE VIII.—96 Great Towns; Greater London; 4 Scottish or Irish Towns.—Birth-rate, Death-rate, and Analysis of Mortality in the 13 Weeks ended 27th September, 1913.

NOTE.—The 96 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The birth-rate is based upon births actually registered in the several towns. The death-rate in London has been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The death-rates in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions, with regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

TOWNS.	ANNUAL RATE PER 1000 PERSONS LIVING.										RATE PER 1000 BIRTHS.		ANNUAL DEATH-RATE PER 1000 LIVING.		PERCENTAGE OF TOTAL DEATHS.

\* This table is supplied by the Medical Officer of Health of the Administrative County of London, and is compiled from returns which the London County Council receives from the Metropolitan Asylums Board under section 55 (4) of the Public Health (London) Act, 1891.

† Based on the results of the Censuses of 1901 and 1911.

‡ The diagnosis in these cases was subsequently found to be incorrect.

TABLE XII.—PROPORTION to POPULATION of CASES of INFECTIOUS DISEASE NOTIFIED in certain LARGE TOWNS of ENGLAND and WALES during the 13 Weeks ended 27th September, 1913.

TOWNS.	Annual Rate per 1,000 Persons living.									
	Total Cases.	Enteric Fever.	Typhus.	Continued Fever.	Small-pox.	Scarlet Fever.	Diphtheria (including Membranous Group).	Cholera.	Erysipelas.	Puerperal Fever.

**Marriages**—*July, August, September, 1913, & Year 1913.*

**Births and Deaths**—*October, November, December, 1913, & Year 1913.*

NOTE.—The figures in this publication are tabulated mainly from statistical Returns furnished by the local Registrars, and may not be found to correspond exactly with the authoritative figures for the whole year to be published later in the Annual Report. *With this and subsequent issues of the December Quarterly the principal tables hitherto published in the Annual Summary will be incorporated, and the issue of the Summary as a separate publication will be discontinued.*

*General Register Office, Somerset House,  
14th February, 1914.*

### QUARTERLY RETURN.

#### ENGLAND AND WALES.

The figures in this Quarterly Return are based upon the BIRTHS and DEATHS registered in the 1,986 registration sub-districts of England and Wales in the three months ended 31st December, 1913; and the MARRIAGES in 15,944 churches or chapels, in 16,424 registered places of worship unconnected with the Established Church, and in 633 Superintendent Registrars' Offices, in the three months ended 30th September, 1913.

The births registered during the three months ended 31st December, 1913, numbered 212,135 and the deaths 123,261; the number of persons married during the three months ended 30th September, 1913, was 167,164.

#### Marriages.

The number of persons married during the *third* quarter of 1913 corresponds to an annual rate of 18·0 per 1000 of the population, which is estimated to amount to 36,919,339 persons at the middle of the year 1913; this is 0·8 per 1000 above the mean marriage-rate in the ten preceding third quarters, but 0·1 per 1000 below the rate recorded in the third quarter of 1912.

### Births.

The births registered in the *fourth* quarter of 1913 correspond to a rate of 22·8 annually per 1000 of the population, which is 2·2 per 1000 below the mean birth-rate in the ten preceding fourth quarters, and 0·3 per 1000 below the rate in the corresponding period of 1912.

### Natural Increase of Population.

The natural increase of population in England and Wales last quarter by excess of births over deaths was 88,874, against 86,280, 85,506, and 87,975 in the fourth quarters of 1910, 1911, and 1912, respectively.

### Deaths.

The deaths registered in England and Wales last quarter correspond to an annual rate of 13·2 per 1000 persons living; this rate is 1·6 per 1000 below the mean rate in the ten preceding fourth quarters, and 0·4 below the rate recorded in the corresponding period of 1912.

The 123,261 registered deaths included 63,553 of males and 59,708 of females, the death-rate among males being 14·1, and that among females 12·4, per 1000 of the estimated populations of the respective sexes. Compared with the average for each sex in the ten preceding fourth quarters, the death-rate of males showed a decrease of 1·6, and that of females a decrease of 1·6 also. Out of equal numbers living, the deaths of males were to those of females as 114 is to 100, the mean proportion in the fourth quarters of the ten preceding years being 112 to 100.

### Mortality at Different Ages.

Infantile mortality, measured by the proportion of deaths under one year of age to registered births, was equal to 113 per 1000, being 13 per 1000 below the average in the ten preceding fourth quarters.

The mortality among persons aged between one year and sixty-five years was at the annual rate of 7·2 per 1000 of the estimated population at this group of ages.

Among persons aged sixty-five years and upwards the mortality was at the annual rate of 76·5 per 1000 of the estimated population at this group of ages.

### Urban and Rural Mortality.

Table III. shows the birth-rates, the death-rates from all causes, from the principal epidemic diseases and from violence, and the death-rates at certain age groups, together with the proportion of inquest cases, of uncertified deaths, and of deaths in public institutions in England and Wales during the *fourth* quarter of 1913, compared with the corresponding average rates in the *fourth* quarters of the ten preceding years, and also with the rates last quarter in the 96 great towns, in the 145 smaller towns, and in the remainder of England and Wales.

In the country as a whole the mortality from diphtheria last quarter was slightly below the average; that from measles was less than half the average, and that from enteric fever, scarlet fever, and whooping-cough about two-thirds of the average.

The highest death-rates per 1000 persons living from the several epidemic diseases among the 96 great towns last quarter were as

follows :—from *enteric fever*, 0·20 in Great Yarmouth, 0·22 in Gateshead, 0·25 in Hull, 0·29 in Dudley, and 0·37 in Wigan ; from *measles*, 0·82 in Norwich, 1·03 in Stockport, 1·14 in Middlesbrough, 1·27 in Barnsley and 1·91 in Burnley ; from *scarlet fever*, 0·32 in Sunderland, 0·36 in Stockton on Tees, 0·38 in Middlesbrough, 0·41 in Preston and 0·74 in South Shields ; from *whooping cough*, 0·30 in Birkenhead and in Bolton, 0·32 in Oldham and in Coventry, and 0·35 in Wallasey ; and from *diphtheria*, 0·52 in Southampton, 0·59 in Great Yarmouth, 0·62 in Northampton and 0·78 in Cambridge. The highest death-rates per 1000 births from *diarrhœa and enteritis* among children under 2 years of age were 59·46 in West Bromwich, 63·48 in Bolton, 74·94 in Oldham, and 85·55 in Preston.

#### UNITED KINGDOM.

The POPULATION of the UNITED KINGDOM in the middle of 1913 is estimated at 46,026,547 persons ; that of England and Wales at 36,919,339, that of Scotland at 4,728,132, and that of Ireland at 4,379,076.

In the United Kingdom 264,460 *births* and 157,204 *deaths* were registered in the three months ended 31st December, 1913. The natural increase of population was, therefore, 107,256. The number of *persons married* in the United Kingdom during the quarter ended 30th September, 1913, was 196,004.

The birth-rate in the United Kingdom in the *fourth* quarter of 1913 was 22·8, and the death-rate 13·6, per 1000 of the estimated population. The marriage-rate in the *third* quarter of 1913 was 16·9 per 1000.

For facts, in detail, concerning Scotland and Ireland reference should be made to the Quarterly Returns of the Registrars-General of those parts of the United Kingdom.

#### Passenger Movement.

According to a Return issued by the Board of Trade it appears that with respect to the passenger movement between the United Kingdom and places out of Europe in the three months ended 31st December, 1913, the departures of passengers stated to be of British nationality exceeded the arrivals by 19,130 persons, a decrease of 58 per cent. as compared with the corresponding period of the previous year. Of aliens those leaving exceeded those arriving by 2,808, the balance in the corresponding period of the previous year having been 1,572.

The passenger movement between the United Kingdom and the Continent of Europe showed a balance outward of 16,445 persons, British and aliens, in the fourth quarter of the year. The excess of aliens departing for the Continent over those arriving from the Continent in the fourth quarter was 3,263 against 6,549 in the corresponding quarter of 1912.

Thus the balance of the aggregate passenger movement in the quarter to and from all Countries was 38,383 outward.

#### COLONIAL AND FOREIGN CITIES.

The Registrar-General has been favoured with returns of vital statistics by the authorities of 28 of the principal Colonial and Foreign Cities. From these a summary has been constructed for the 14 weeks ended 3rd January, 1914 (Table XV.).

## RETURNS OF NOTIFIED CASES OF INFECTIOUS DISEASE.

At the request of the Local Government Board, and of the London County Council, and on their responsibility with respect to accuracy, tables have been inserted, in continuation of those published in previous returns, showing the numbers of cases of infectious sickness notified, under Act of Parliament, to the Sanitary Authorities of certain of the largest towns in England and Wales, during the 14 weeks ended 3rd January, 1914 (*see* pages 21-26); and in the two following tables, these numbers have been reduced to rates per 1000 living in the several populations (*see* pages 27-32).

### Meteorology.\*

The weather of the quarter was for the most part mild and fairly dry, an important feature being the unusual warmth of the nights throughout October and November and the almost entire absence of sharp autumnal frost. During the earlier half of the period nearly all districts were visited in turn by falls of rain of more than ordinary intensity, and throughout the quarter as a whole thunderstorms were unusually frequent for the time of year. On the evening of October 27th a violent tornado passed from south to north along the Taff Valley, Glamorgan, occasioning a large amount of structural damage and some loss of life. In connection with the disturbance a destructive whirlwind was experienced at about the same time in some parts of Shropshire and Cheshire. Over the south-eastern quarter of England, November and December were very dry; in several parts of the country an entire absence of rain was reported during the second and third weeks of the latter month.

*October* was exceedingly mild, the mean temperature at many places in the south and south-east of England being more than 5° above the normal. In the daytime the thermometer rose frequently above 60°, and occasionally above 65°, a reading as high as 70° being recorded on the 2nd in London (at Camden Square) and at Chelmsford. Practically the only touch of cold weather occurred on the 23rd, when the thermometer at several places in the north failed to reach 45°. On the succeeding night, or on that of the 24th, a rather sharp frost was experienced in most districts, the thermometer early on the 25th falling to a minimum of 24°. The prevailing winds were from the Southward or South-eastward, and although gales were rare thunderstorms and heavy falls of rain were frequent, more especially in the low lying parts of the country. The principal downpours occurred on the 5th or 6th over the centre and southern parts of England, on the 7th in the northern counties, and on the 26th over the south-eastern quarter generally. On the 5th the fall exceeded 2½ in. in several places, and amounted to as much as 3·1 in. at Boston, Lincolnshire. A good deal of fog prevailed in most inland districts between the 23rd and 26th.

In comparison with the normal the weather in *November* was even milder than in October, many districts reporting an entire absence of frost. As a rule the midday temperatures were well above 50°, and on some few occasions they were locally above 60°, a reading as high as 65° being observed at Tavistock on the 12th, and at Ashburton on the 29th. The night temperatures were usually above 40°, but sharp

---

\* Furnished by the Director of the Meteorological Office.

frosts occurred in Central Scotland between the 6th and 8th, and at a few inland stations in England on the 23rd, the sheltered thermometer falling on the latter occasion to  $21^{\circ}$  at Wokingham and to  $22^{\circ}$  at Raunds. Heavy falls of rain occurred rather frequently in the hilly portions of the western and north-western districts, the principal cases being observed round Snowdon on the 12th, and in Wales and the south-west of England on the 20th. In England the individual falls were seldom of any great weight and the total amount for the month was considerably below the normal. Fog occurred rather frequently on the east and west coasts, but over the country generally it was unusually rare for the time of year. Owing largely to the clearness of the atmosphere the duration of bright sunshine was in most districts largely in excess of the average.

*December* was marked by a continued superabundance of mild weather, the thermometer rising very frequently above  $50^{\circ}$ ; on the 8th or 9th readings above  $55^{\circ}$  were recorded over a wide area, and a reading of  $60^{\circ}$  at Sandown (I.W.). A severe frost was, however, experienced in Scotland between the 4th and the 7th, and over the country generally in the closing days of the month. On December 31st the sheltered thermometer fell below  $15^{\circ}$  in many parts of the United Kingdom and reached  $9^{\circ}$  at Rounton and  $10^{\circ}$  at Worksop. Gales (mostly from some Westerly quarter) were experienced frequently during the month, but heavy falls of rain were rare and were confined mainly to the mountainous regions in Wales, Cumberland and the west of Scotland. During the second and third weeks many places reported an entire absence of rain lasting for many days. At Durham no rain fell throughout the 20 days ended December 24th. The cold Northerly winds which prevailed at the close of the month were accompanied in some of the northern and central districts by heavy falls of snow; at Rounton the ground was covered on the 30th to a depth of  $9\frac{1}{2}$  inches.

For the quarter as a whole the *mean temperature* was considerably above the normal, the excess varying in most districts between  $2\frac{1}{2}^{\circ}$  and  $3^{\circ}$ . During the previous 35 years there were only two cases in which the fourth quarter of the year was equally mild. In 1908 the mean temperature over the country generally was about the same as in 1913, and in 1898 it was appreciably higher. The highest readings occurred at the beginning of the quarter, mostly between October 1st and 3rd, when the thermometer rose to  $65^{\circ}$  and upwards in many places and touched  $70^{\circ}$  at Camden Square and Chelmsford. The lowest temperatures were observed in nearly all places on December 31st, when the sheltered thermometer sank below  $20^{\circ}$  in all but the eastern and south-eastern districts, and reached  $9^{\circ}$  at Rounton. At Worksop a thermometer exposed on the grass fell on the same day to  $4^{\circ}$  below zero.

The *rainfall* of the quarter amounted to less than the average in all districts, the deficiency being small (only 1 per cent.) in the Scilly and Channel Islands, but rather larger over the northern parts of the country. In the north-east of England less than three fourths of the normal quantity was recorded. The totals in the various districts ranged from about 12 in. in the south-west and the Channel Islands to a trifle over 6 in. in the eastern counties and to 5.5 in. in the north-east of England. October was distinguished by frequent heavy downpours, accompanied in many instances by thunderstorms of considerable severity. In November and December heavy falls were confined mainly to the hilly districts in the west and north.

*Bright Sunshine* was in excess of the average, the difference amounting to more than 10 per cent. in most districts, to 20 per cent. in the south-east of England, and to as much as 27 per cent. in the eastern counties. The duration was especially large in November, many stations in the south and east of England recording at least 40 per cent. more than the average amount, Oxford and Cambridge 54 per cent. more, and Rothamsted 55 per cent. more.

---

### SUMMARY, 1913.

The Summary relating to the year 1913, giving the principal Tables published hitherto in the "Annual Summary" will be found on pages 36 to 64 of this publication, the Tables being numbered XVI to XXVII.

### ENGLAND AND WALES.

According to the quarterly returns furnished by local registrars, 881,480 births and 505,026 deaths were registered in England and Wales in the year 1913. The natural increase of population, by excess of births over deaths, was therefore 376,454, the average annual increase in the preceding five years having been 393,848. The number of persons married during the year was 572,584.

The marriage-rate in England and Wales in 1913 was 15·5 persons married per 1,000 of the population, being the same as the rate in 1912. Compared with the average in the ten years 1903-1912, the marriage-rate in 1913 showed an increase of 0·2 per 1,000.

The birth-rate in 1913 was 23·9 per 1,000 of the population, which is 0·1 per 1,000 above the rate in 1912, but lower than the rate in any other year on record. Compared with the average in the ten years 1903-1912, the birth-rate in 1913 showed a decrease of 2·4 per 1,000.

The death-rate in 1913 was 13·7 per 1,000, which was 0·4 per 1,000 above the rate in 1912; compared with the average rate in the ten years 1903-1912, the death-rate in 1913 showed a decrease of 1·2 per 1,000.

\* Based on the results of the Censuses of 1901 and 1911.

TABLE V.—**England and Wales and Registration Counties.**—ESTIMATED POPULATION: MARRIAGES registered in the Quarter ended 30th September, 1913; BIRTHS and DEATHS registered in the Quarter ended 31st December, 1913.

NOTE.—The Registration or Union Counties consist of groups of Registration Districts which are generally co-extensive with Poor Law Unions of the same names. The differences between Registration Counties and Administrative Counties are shown in Table 7 of Vol. II. of the Abstracts of the Census Returns, 1911 (Cd. 6239). The numbers of marriages, births, and deaths, are the numbers actually registered in each case.

TABLE VII.—96 Great Towns; Greater London; 4 Scottish or Irish Towns.—Population; Births, Deaths, and Meteorology in the 14 Weeks ended 3rd January, 1914.

NOTE.—The 96 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths in London have been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The deaths in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

\* The values for Mean Temperature and Rainfall relate to the calendar quarter.

† The figures for Edinburgh and Glasgow relate to the calendar quarter. The deaths are corrected throughout by deduction of deaths of non-residents domiciled in Scotland, and by addition of deaths of residents registered elsewhere in Scotland.

‡ Including deaths of persons admitted into public institutions from without the boundaries of Dublin and Belfast respectively.

§ The figures for Middlesbrough and Stockton on Tees throughout the whole period refer to these towns as before extension on 9th November 1913

<sup>a</sup> Phoenix Park.

<sup>b</sup> Fitzwilliam Square.

TABLE VIII.—96 Great Towns; Greater London; 4 Scottish or Irish Towns.—Birth-rate, Death-rate, and Analysis of Mortality in the 14 Weeks ended 3rd January, 1914.

NOTE.—The 96 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The birth-rate is based upon births actually registered in the several towns. The death-rate in London has been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The death-rates in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

\* The figures in this table, excepting those for London, which are derived from Table XI., are compiled and furnished to the Registrar-General by the Medical Officer of the Local Government Board.

† Based on the results of the Censuses of 1901 and 1911.

‡ The figures for Southsea District of Portsmouth are—population (1911), 25,380; enteric fever, 2; typhus, nil; continued fever, nil; small-pox, nil; scarlet fever, 17; diphtheria (including membranous croup), 20; erysipelas, 2; and puerperal fever, nil.

§ The number of cases notified for these towns include those for the areas as extended from 9th November, 1913. The estimated populations of the extended areas in the middle of 1913 are as follows:—Southend on Sea, 79,789; Stockport, 124,120; Liverpool, 763,434; Manchester, 731,019.

London - - - -	24'5	14'2	14'2	0'02	—	0'34	0'04	0'17	0'09	0'56	

  

	ANNUAL DEATH RATE PER 1,000 BIRTHS.		ANNUAL DEATH-RATE PER 1,000 LIVING.		PERCENTAGE OF TOTAL DEATHS.			
	Diarrhoea and Enteritis (under 2 years).	Total under 1 year.	Aged 1 to 65 Years.	Aged 65 Years and upwards.	Deaths in Public Institutions	Certified Causes.	Inquest Cases.	Uncertified Causes.
England and Wales -	23'41	109	7'5	80'3	21'2	91'6	7'2	1'2
96 Great Towns (including London).	29'33	117	8'2	84'1	27'8	91'3	7'9	0'8
145 Smaller Towns - -	24'73	112	6'9	79'7	14'7	92'6	5'9	1'5
England and Wales, less the 241 Towns.	14'39	96	6'7	76'9	14'0	91'7	6'6	1'7
London - - - -	27'50	105	8'0	84'0	43'6	89'6	10'3	0'1

\* The Standardized Death-rates represent the Crude Death-rates multiplied by the respective Standardizing Factors in order to make correction for differences of sex and age constitution of the several populations in 1911 as compared with that of England and Wales in 1901. A description of the method of constructing these Factors is to be found in the Annual Report for 1911, p. xxix. Owing to the difficulty of distributing to their proper areas deaths occurring in public institutions the death-rate of the rural area is probably somewhat overstated.

NOTE.—The 96 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The births shown in this table are those registered in the several towns without correction, except in the case of London. The births in London have been corrected by the transference of those occurring in the principal institutions receiving maternity cases. The deaths in London have been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See Table XXI.) The deaths in the other towns have been corrected, as far as possible (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying Public Institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

TOWNS.	ESTIMATED POPULATION in the middle of 1912.*	BIRTHS.	DEATHS.	The Deaths registered include										MEAN TEMPERATURE (Degrees Fahr.).	RAIN-FALL (Inches).	TOWNS.

\* The values for Mean Temperature and Rainfall relate to the calendar year.

† The figures for Middlesbrough and Stockton on Tees relate throughout the whole period to the boroughs as before extension on 6th November, 1913.

‡ As extended on 9th November, 1912.

\$ The figures for Edinburgh and Glasgow relate to the calendar year. The deaths are corrected throughout by deduction of deaths of non-residents domiciled in Scotland and by addition of deaths of residents registered elsewhere in Scotland. The deaths in Dublin and Belfast are exclusive of those of persons admitted into public institutions from without the boundaries of the respective cities.

\* For the purpose of this table the Births registered in London have been corrected by distributing those which occurred in the principal institutions receiving maternity cases to the boroughs in which the mothers resided. In 1263 cases the residence was outside the County of London and these cases have been excluded. On the other hand 44 births that occurred outside the County have been included. With regard to the Deaths of London residents, all transferable deaths (*i.e.*, those of persons who, having a fixed or usual residence in England and Wales, die in a district other than that in which they resided) occurring in Greater London and in certain Metropolitan Institutions outside Greater London have been distributed to the Metropolitan Borough to which the deceased belonged. Of the deaths registered in London the previous residence was outside the county in 3412 cases, while on the other hand the deaths of 2973 London residents occurred in the Outer Ring or in Metropolitan Institutions outside Greater London.

† Based on the results of the Censuses of 1901 and 1911.

TABLE XXII.—LONDON and the METROPOLITAN BOROUGHES.—Birth-rates and Death-rates of Persons belonging to London and the Metropolitan Boroughs during the 53 Weeks ended 3rd January, 1914.

BOROUGH.	PER 1000 PERSONS LIVING.										RATE PER 1000 BIRTHS.	
	Births.	Deaths from								Diarrhoea and Enteritis (under 2 years).	Total Deaths under 1 year.	
		All Causes.		Enteric Fever.	Small-pox.	Measles.	Scarlet Fever.	Whooping cough.	Diphtheria.			Pulmonary Tuberculosis.
		Crude.	Standardized.*

\* The Standardized death-rates represent the Crude death-rates multiplied by the respective Standardizing Factors in order to make Correction for differences of sex and age constitution of the several populations in 1911 as compared with that of England and Wales in 1901. A description of the method of constructing these Factors is to be found in the Annual Report for 1911, page xxix.

TABLE XXIII.—NUMBER of CASES of INFECTIOUS DISEASE NOTIFIED in certain LARGE TOWNS of ENGLAND and WALES during the 53 Weeks ended 3rd January, 1914.\*

CITIES, BOROUGHES, and URBAN DISTRICTS.	Estimated Population in the middle of 1913.†	Total Cases.	Enteric Fever.	Typhus.—	Continued Fever.	Small- pox.	Scarlet Fever.	Diphtheria (includ- ing Membranous Croup).	Cholera.	Erysipelas.	Puerperal Fever.

\* The figures in this Table, excepting those for London, which are derived from Table XXIV., are compiled and furnished to the Registrar-General by the Medical Officer of the Local Government Board.

† Based on the results of the Censuses of 1901 and 1911.

‡ The figures for Southsea District of Portsmouth are—population (1911), 25,380; enteric fever, 5; typhus, nil; continued fever, nil; small-pox, nil; scarlet fever, 66; diphtheria (including membranous croup), 66; erysipelas, 10; and puerperal fever, 1.

§ The number of cases notified for these towns include those for the areas as extended from 9th November, 1913. The estimated populations of the extended areas in the middle of 1913 are as follows:—Southend on Sea 79,789, Stockport 124,120, Liverpool 763,434, Manchester 731,019.

TABLE XXIII. (continued).—NUMBER of CASES of INFECTIOUS DISEASE NOTIFIED in certain LARGE TOWNS of ENGLAND and WALES during the 53 Weeks ended 3rd January, 1914.\*

\* The hours of observation are 9 a.m. and 9 p.m. local time.

† The averages used are obtained from observations extending over 65 years for Rain, 70 years for Temperature, and 16 years for Sunshine.  
Wind Force.—Beaufort Scale (0-12) is used. The Summary is obtained from the records of a cup anemograph having 5 in. cups and 15 in. arms.  
Winds above 37 miles per hour are reckoned as gales and winds between 21 and 37 miles per hour as moderate or strong winds. The factor used is 3.

\* A day is reckoned as a day of "clear sky" if the average of the estimates of the fraction of sky covered by cloud at 9 a.m., 3 p.m., and 9 p.m. is less than .2, and as an "overcast" day if the average is greater than .8. Record is also kept of the days persistently cloudless and days persistently overcast from midnight to midnight. The number of such days for the period January to December, 1913, are:—Cloudless, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0; and overcast, 3, 1, 0, 1, 0, 0, 2, 0, 2, 1, 0, 1.

TABLE XXVI.—LONDON.—Meteorology at Greenwich in each Week of 1913.
